## 1.0 IMPORTANT NOTICE & INTRODUCTION

### IMPORTANT NOTICE

Please read before attempting service

1. While the monitor is in operation, do not attempt to connect or disconnect any wires.
2. Make sure the power cord is disconnected before replacing any parts in the monitor.
3. When the power is on, do not attempt to short any portion of the circuit. This shorting may cause damage to the transistors in the monitor.
4. When servicing the H.V. area, be certain that the C.R.T anode is safely discharged before removing the anode cap.
5. Caution must be exercised when servicing this monitor.

### INTRODUCTION

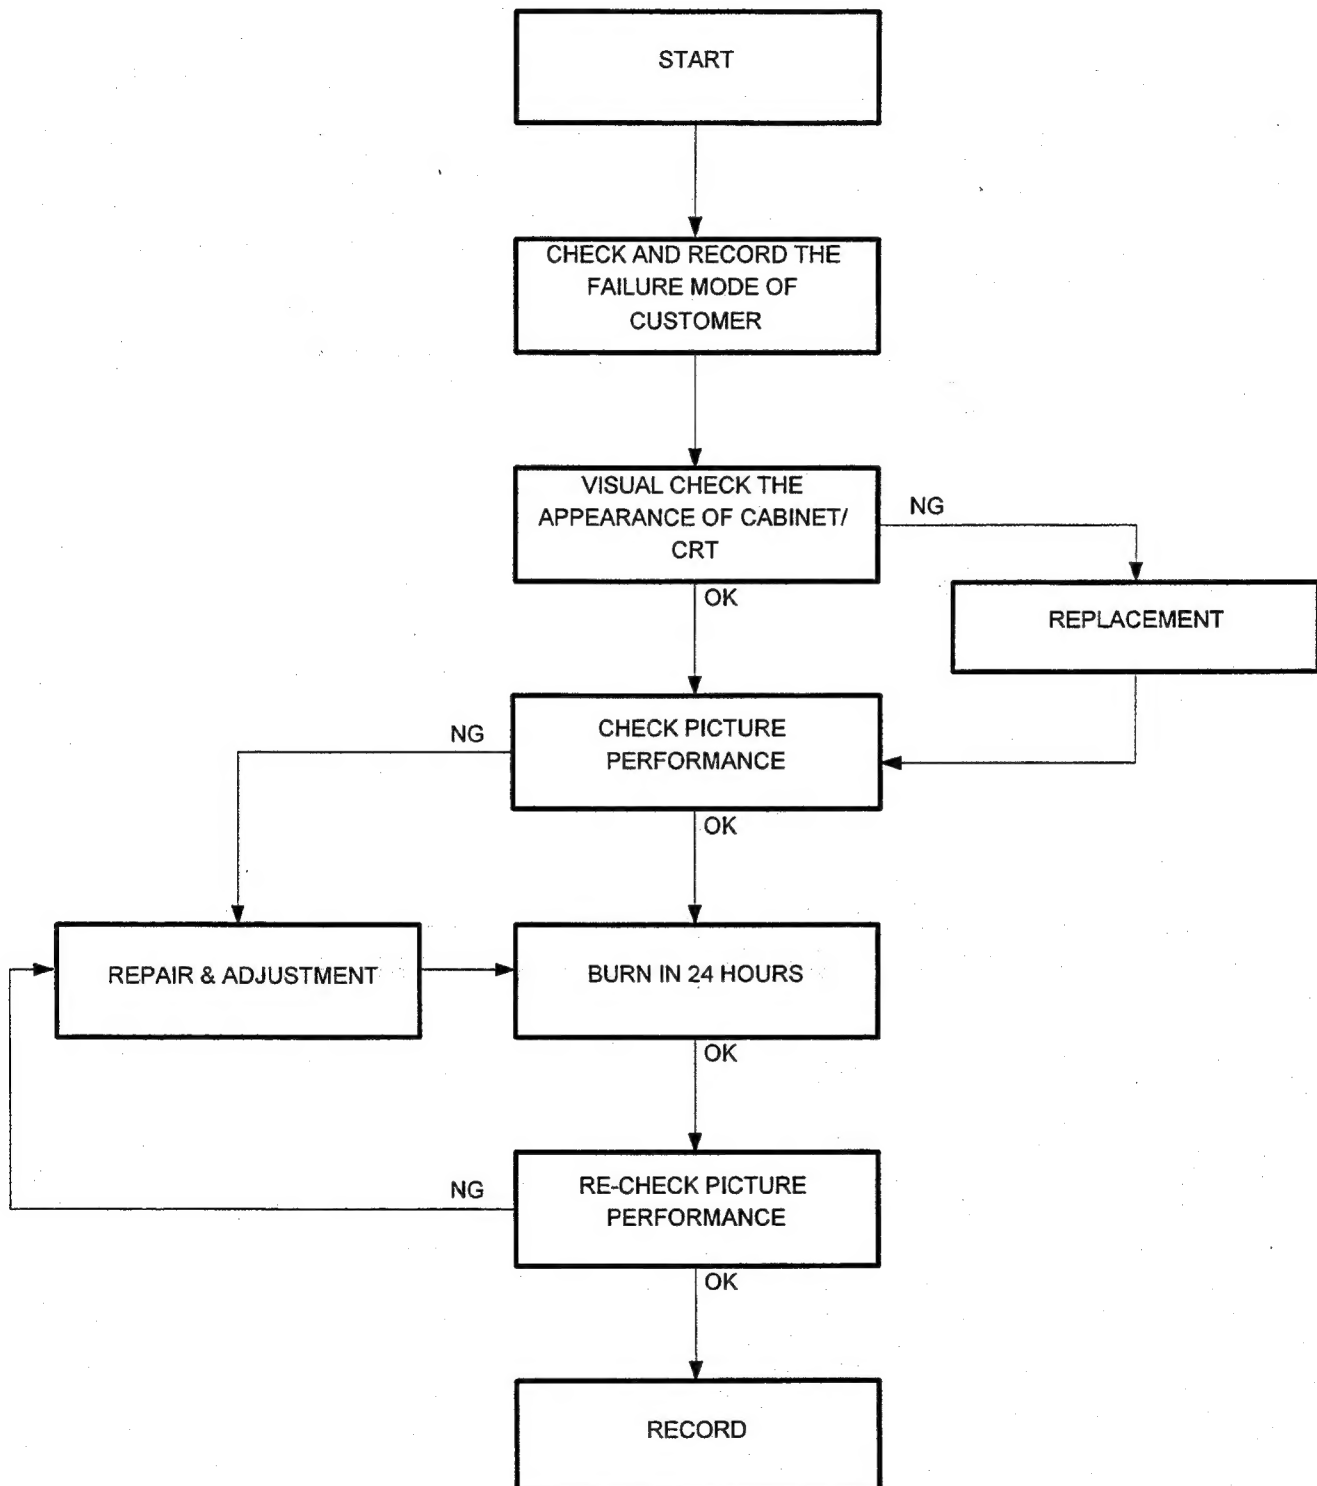

Enhanced repair capabilities

This troubleshooting guide is edited for model 1769E/SE.1792E/SE when service is necessary. There are four primary parts included in this troubleshooting guide which offer the easiest way to locate problem points and repair the machine to the best possible condition.

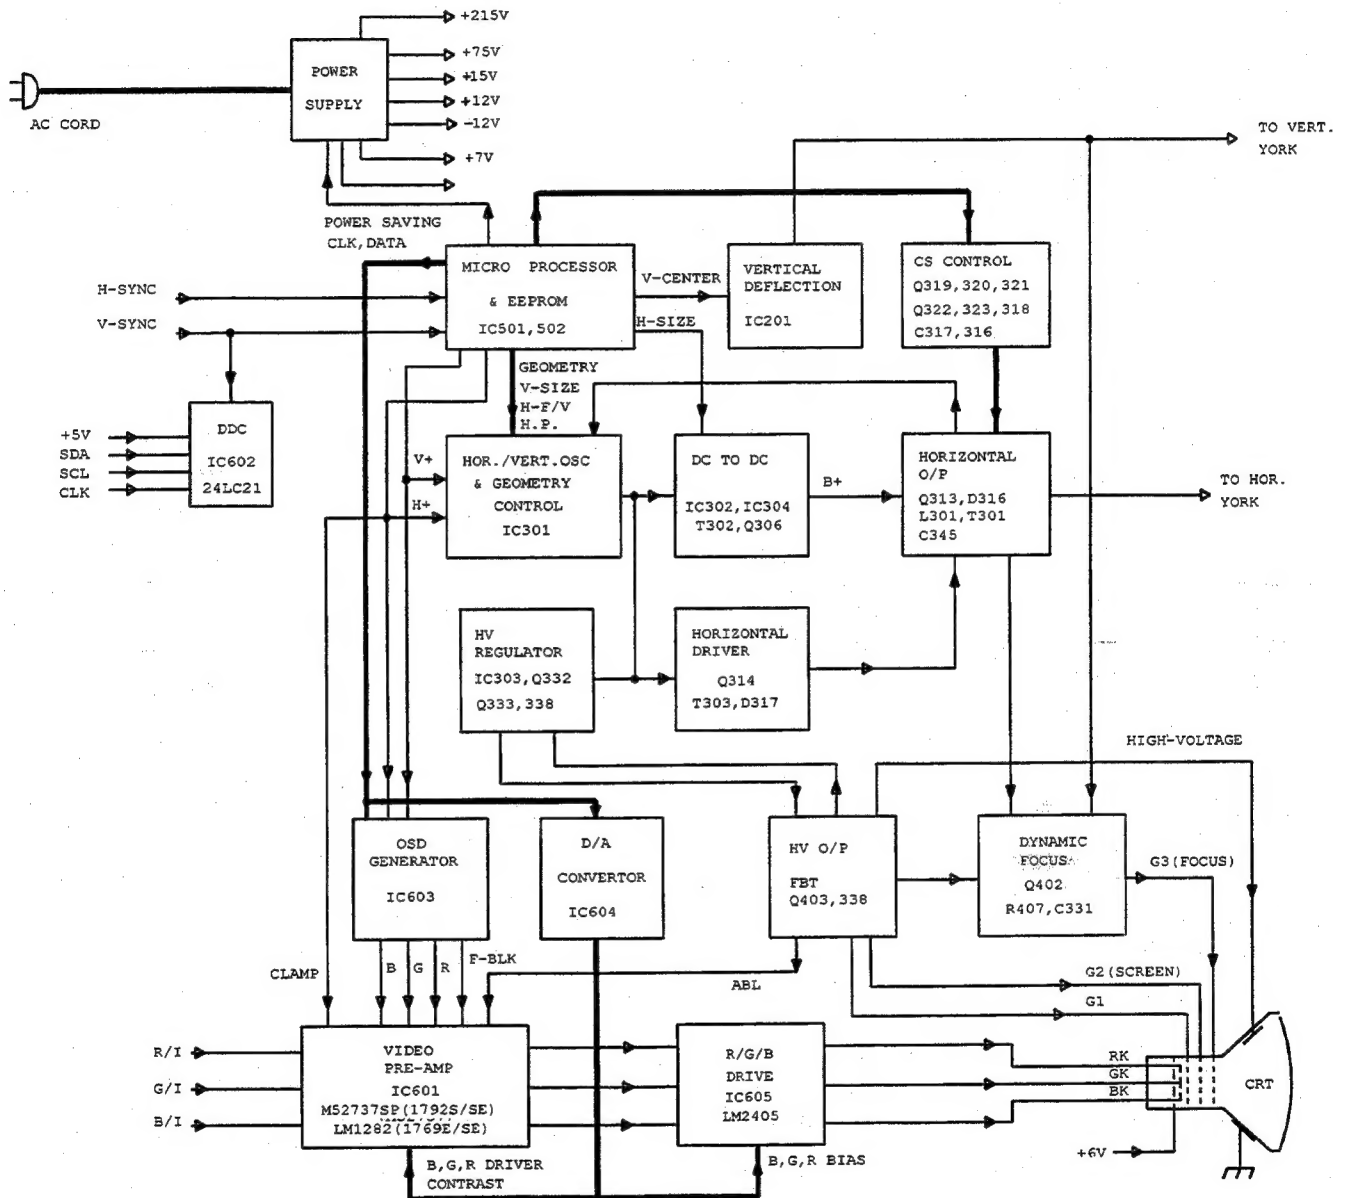

1. The Adjustment section offers the adjustable method, steps and all data of the factory's initial settings which can make the machine get the best performance at that time. By the way, before adjusting, the machine must be warmed up for at least 10 minutes and the CRT face must be in an eastward direction.
2. The Troubleshooting section has four main parts including: power supply, micon circuit, CRT, deflection & video circuit. Each offers fast repair routine and the IC, transistor voltage records against all specified signal modes. These voltage readings are measured with a HP 34401A multimeter with input impedance  $10M\Omega$  (0.1V~1000V range) and waveforms shown on circuit schematics are measured by a Tektronix TDS 520 digital oscilloscope, the monitor receives VGA-480 full white square pattern.

### 1.0 IMPORTANT NOTICE & INTRODUCTION

3. The CRT contrast list offers repairmen / technicians the contrast data when CRT replacement is necessary from a different type of CRT.
4. The Spare parts list offers the CTX part number (P/N) which is used frequently by repairmen / technicians. For details please refer to the service guide or service manual. If there is any engineering change regarding this model, CTX will issue the updated information by a non-periodical Technical Bulletin.
5. The transistor voltage records are measured from LEFT side to RIGHT side when face to the front (printed side) of transistor.

**2.0 GENERAL MAINTENANCE PROCEDURE**

## 3.0 FUNCTION BLOCK DIAGRAM

## 4.0 DESCRIPTION OF CIRCUIT

### 1. Power supply circuit

The power supply is a serial & universal AC input switching power supply. The start up circuit (Q101, C105) will provide a DC voltage for PWM (Pulse Width Modulation) IC (IC101) when power on. When IC101 works normal, Q101 will be cut off by the DC voltage from T101 secondary winding. The IC101 will Auto-detect output voltage of power supply from Pin2 and correct the duty cycle of Pin6 output pulse to compensate the variation of output voltage.

The output of IC101 Pin6 connected to power mosfet to drive the power transformer T101. When power mosfet is on, the energy stored in the primary winding of T101. Once mosfet is off, the energy transfer to the secondary and charges the output capacitor to get the stable DC voltage.

### 2. Oscillation circuit

The functions V-size, V-center, Side-pin, Parallel ....are designed inside into IC301. The Pin26 of IC301 is H-sync input, Pin25 is H-phase control, Pin13 is square wave output and connected to horizontal output stage & H.V output stage. The Q420, Q421 are X-RAY protect input. When H.V. output circuit is abnormal (H.V. too high) the X-RAY protect circuit will shut off the horizontal output, H.V. also will be shut down. The Pin27 is vertical sync input, Pin9 is vertical sync output connected to IC201 (Amplifier), Pin2 of IC201 is vertical amplifier output drives the vertical deflection directly.

### 3. Horizontal output circuit

The DC-DC is to generate a DC voltage ( $B^+$ ) for horizontal output circuit. The IC302 and IC304 are control the H-SIZE, the output of IC304 connected to gate of Q306 to make the Q306 switching. When Q319 is ON, the energy stored in L303 and the energy released when Q306 turned OFF. The  $B^+$  applied to H-DY through T302 primary winding to make horizontal deflection.

### 4. Micon circuit

The function of MICON is to provide the interface between user, PC and monitor. The CPU will detect polarity and frequency of input H.V. Sync.. The CPU will determine

the mode of input timing (preset or users mode) and load mode data from IC502 to IC501. The output of CPU were connected to other function circuit (ie. H-phase, G2, Rotation, H-F/V .....). Also, the user can adjust picture from key board and the data will be saved into IC502 automatically. For the O.S.D. mode, when O.S.D. manual is active CPU will inform the O.S.D IC (IC603) to send O.S.D BLK signal to blank the video signal from VGA card, and the O.S.D. IC will send O.S.D. R.G.B. Video signal the consist the O.S.D. manual. The IC604 is D/A converter, Pin12, 13, 14 of IC604 and Q620, Q621, Q624, Q625, Q622, Q623 are R.G.B. BIAS control. The IC605 is R.G.B..

### 5. H.V. regulation circuit

The PWM control IC3843 is kernel of the circuit. The 3843 will detect the output of H-O/P and then change the duty of Pin6. When Q338 is on, the energy stored in the secondary of power transformer. The energy will be released and to get the  $B^+$  when Q338 turned off. So, the input duty cycle of Q338 gate is higher, the output  $B^+$  is higher. The H.V adjustment circuit consist of Q338, Q403, C407, C402 and H.V regulation CIRCUIT(Q338, Q332, Q333, IC303) which control the H.V output level. The duty cycle of Q338 gate directly control output voltage of C407. The C407 is a supply capacitor which supply the energy to primary winding of FBT and Q335 switch repeatedly to transfer the energy to FBT secondary winding.

### 6. Video output circuit

Video circuit consists of video preamplifier IC601 and output cascode amplifier with IC605, IC601 is a video processing IC equipped with three DC amplifiers to pre-amplify R.G.B. signals from 0.6V to 3V. The voltage gain of these amplifiers are all DC controlled from IC501.

The R.G.B. GAIN & BIAS control signal are from IC604 to IC603, so simple voltage drive with resistors and timmers can be used to adjust the voltage GAIN and BIAS of each R.G.B. signal's amplification and thus achieve a well balance white picture.

The O.S.D. R.G.B.(Pin1, 2, 3 of IC601) is to control picture of O.S.D. window. The IC605 is R.G.B. driver to capable of driving CRT.
